

UML Use Case Diagram

Customer and employee interactions with the BeAvis rental system

Scope: mobile app and website share customer capabilities; employees use staff functions.

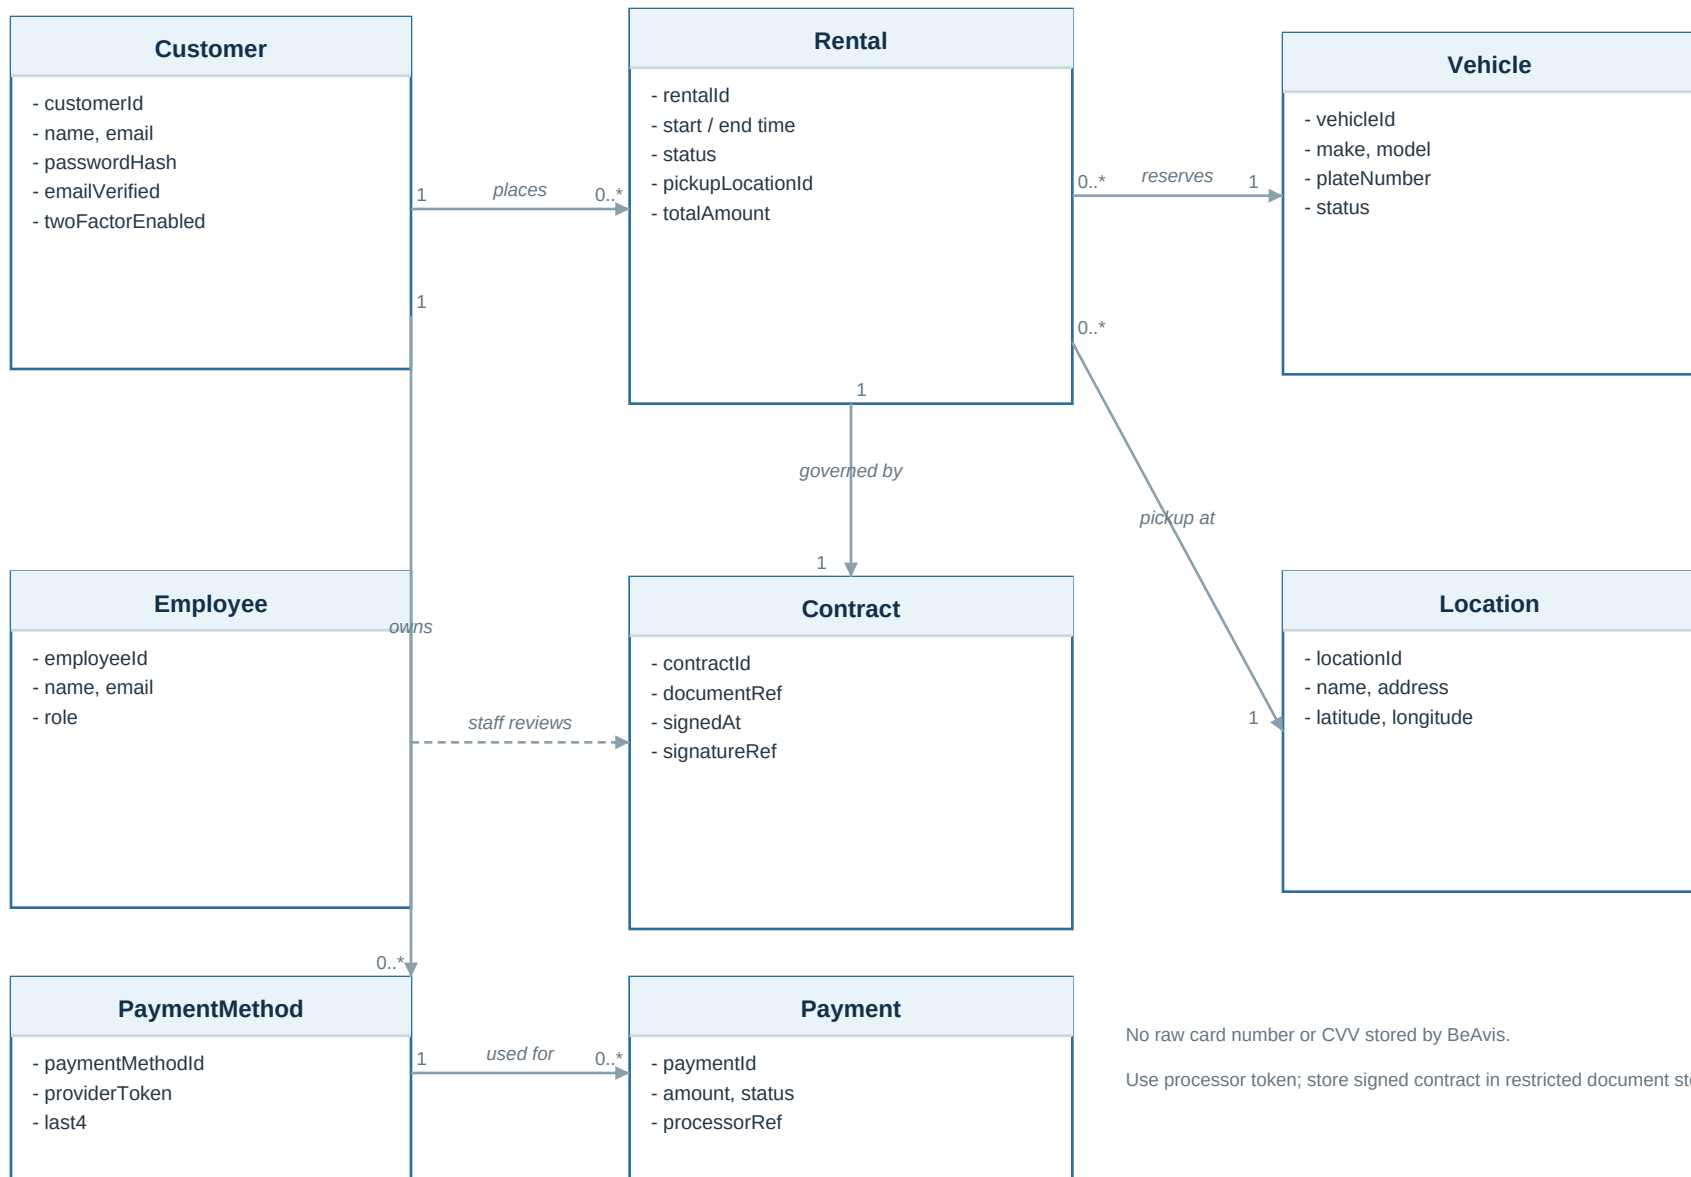

Optional 2FA is enabled by the customer in settings. Payment credentials are isolated from core customer records.

UML Class Diagram

Core domain model inferred from the stated requirements

Multiplicity is illustrative; payment data and signed contracts require restricted storage and access.

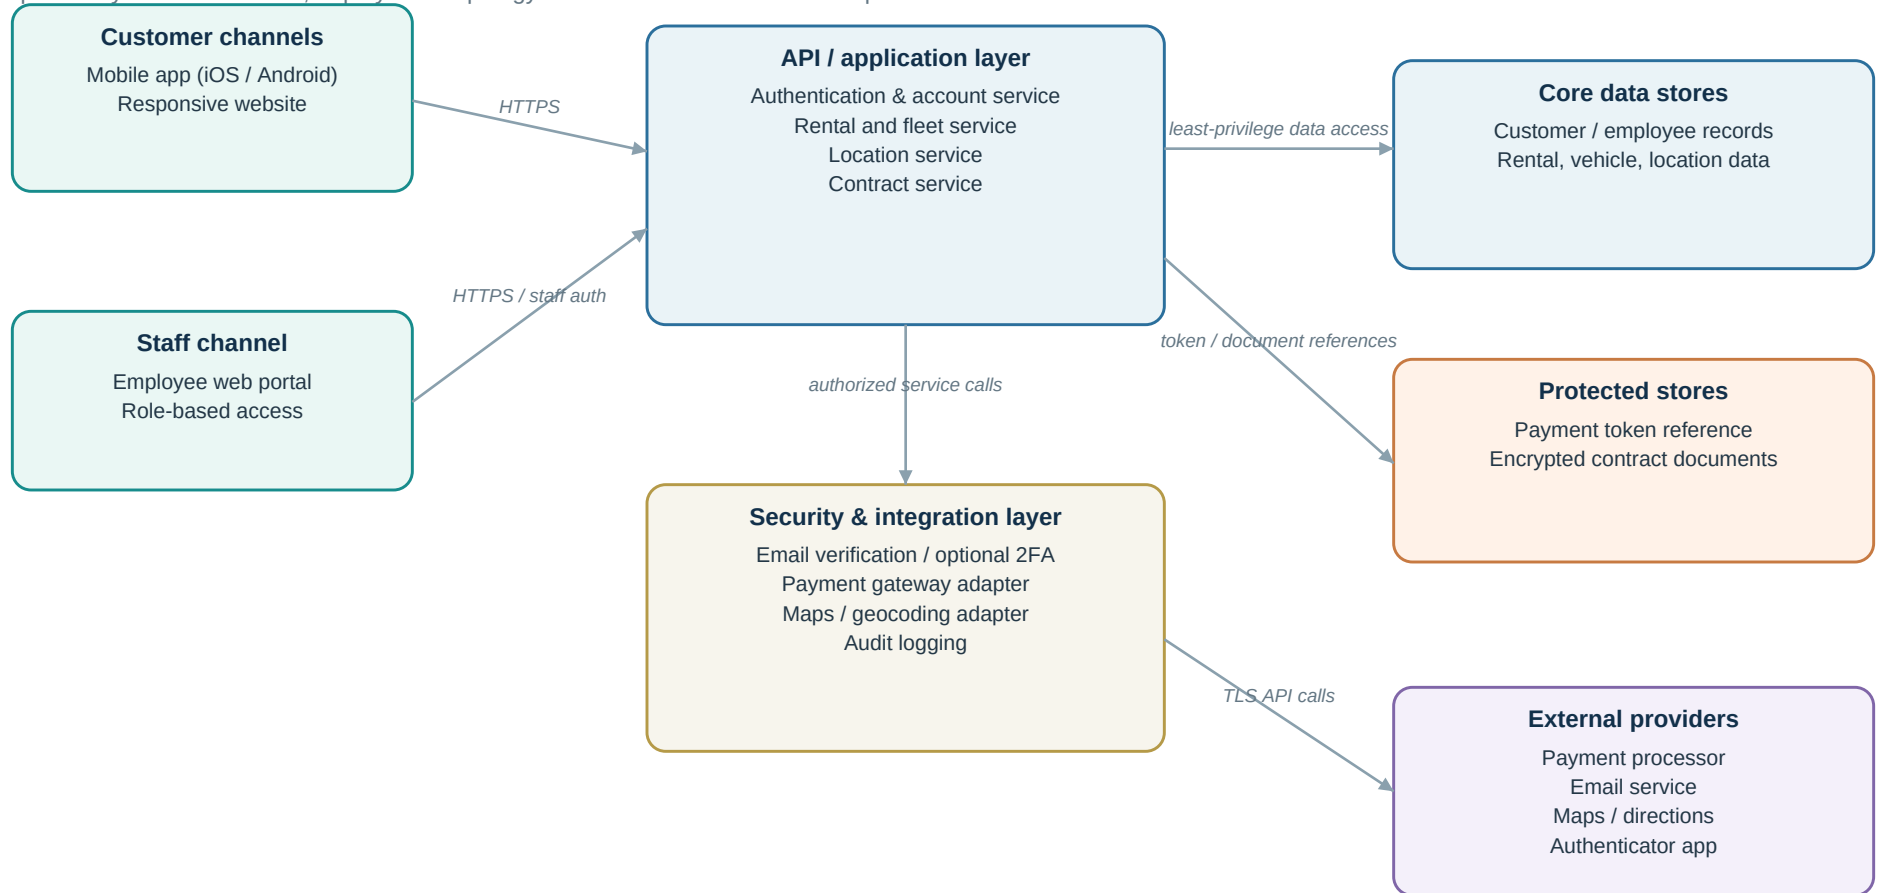

No raw card number or CVV stored by BeAvis.

Use processor token; store signed contract in restricted document storage.

Software Architecture (SWA)

Logical components and primary data flows

Proposed layered architecture; deployment topology and vendor choices remain implementation decisions.

Security boundaries

Keep payment data with the payment provider; BeAvis retains only processor tokens and limited display details.

Encrypt contracts at rest, restrict access by employee role, audit sensitive access, and protect credentials with salted password hashes.
